Team Leader: [Ashok Jangam](#)

Team Size: 4

Problem Statement 5: Supply Chain Ontology and Governed Analytics

CONCORDIA

DIFFERENT TEAMS. SAME TRUTH.

Simulated manufacturer. Five metrics. One answer for every team.

One question. Six source systems. Too many answers.

Mid-size discrete manufacturer · supply chain leadership, procurement, logistics, planning and finance

“What was our on-time delivery in May?”

Procurement

ERP

on time = received by the PO need date

Logistics

TMS

on time = left the dock by carrier pickup

Customer service

CRM

measured against the latest revised promise

Planning

WMS · MES

last night's snapshot, different part numbers

Finance

ERP

missing freight booked as zero cost

What it costs today

- Review meetings open by reconciling numbers, not deciding
- Month-end numbers move later with no record of why
- Chat over raw tables invents a sixth answer
- Cost and audit data leak to people who should not see them

Concordia: each metric defined once, computed once in Snowflake, the same for every team, with its evidence attached.

Architecture: one governed path from source record to answer

Snowflake-native end to end · the language model routes and narrates, SQL computes every number

Synthetic world

seeded simulator, 2 batches

GOV metric contracts (versioned, hashed) · entitlements · rejected aliases · evidence · query audit · pipeline runs

Roles: ADMIN builds, TRANSFORM runs the task, APP_OWNER (never ACCOUNTADMIN) owns the app and uses governed interfaces.

What every team gets: one number, its definition, its evidence

Live Streamlit in Snowflake app over the governed APP layer

Screenshot: Command center as the VP Supply Chain persona, MM-440, May 2026, final as-of. Synthetic data.

1

Five governed metrics

Supplier OTD, customer OTD, fill rate, days of inventory, landed cost. Versioned, hashed contracts.

2

Ask over the ontology

Cortex Analyst generates semantic SQL; a guard proves metric rows against the exact published scope.

3

Ambiguity is refused

Bare “OTD” asks inbound or outbound. “OTIF” is rejected. Missing cost stays incomplete.

4

As-of replay

What was known on the 5th versus final, and what each late load restated.

5

Cross-domain evidence

Supplier-to-customer paths, substitutions, lots, production consumption and synthetic IoT dock events.

End to end, verified on the deployed account

Synthetic world CONCORDIA_SIM_V1 · two extract batches · every check re-run against live Snowflake

35/35

golden checks

SQL equals the independent Python reference

103/103

grid samples

published rows equal a live function call

8/8

hero checks

including the restated landed cost

14/14

security checks

masking, alias refusal, role isolation

Hero: MM-440 servo motor, May 2026, one answer for every team

Supplier OTD

2/3 · 66.7%

Customer OTD

1/4 · 25.0%

Fill rate

40/40 · 100%

Landed cost, 5 Jun

INCOMPLETE

Landed cost, 15 Jul

\$12.50 per unit
